

Can you trust this map?

London heat exposure, H3 resolution 9, Landsat 9 snapshot at 10:52 UTC on 29 July 2026

Heat exposure

London heat exposure

Verified observation

105 of 16,659 cells, 0.63%, meet the declared upper class boundary of 40,000 person-kelvin per km².

Conditions

Land surface temperature is not air temperature or individual heat risk. The threshold is a visual class boundary, not a health threshold. One daytime scene, modelled population and an author-chosen H3 support.
